

# General properties of thermal phase transitions

**Maria Daghofer**

*Institut für Funktionelle Materie und Quantentechnologien,  
Universität Stuttgart, Germany*

We will here cover a few standard examples from theoretical physics: liquid-gas transitions as described by a van-der-Waals gas, or the favorite guinea pig for symmetry-breaking transitions, the Ising model. We will use them to recapitulate the physical processes they describe and to introduce their mathematical treatment.
